

Computer Graphics exam rules

Version 1.0, 10th May 2026.

The Computer Graphics exam will be based on a project, that will be prepared by groups of students, which will be discussed at the exam. In this document, you will see a set of rules and guidelines that will describe how the evaluation will be carried out.

1. Deadlines

- There are no deadlines for completing the project: however, all the process must be completed before the last call in February 2027.
- Students can work on the project whenever they think it is more convenient, but the presentations will be scheduled only on a date that is near to the ones officially proposed for the exam by the on-line service system. Exception might be possible and can be discussed if necessary.
- In most of the calls, a *Form based registration system* will be set up, and a link will be sent to all the students who requested the exam on Servizi Online, at a time very close to the official exam date, after the exam registrations are closed. By filling in the form, the students will be able to choose from a set of fixed dates. In all the calls, however, the form will be set up only if the number of registered students is larger than what can be accommodated in the single exam date shown on Servizi On Line. In some special cases, extra dates might be arranged to help the students with special needs: however, the mark can only be registered on an official exam date afterward. Unfortunately, in the event of discussing a project outside the official period, no certificate proving that the exam was passed can be emitted before the mark has been registered.

2. Project presentation

- Projects will be discussed by all the members of the team in the same session: ***every group component must be present for the project presentation!*** Please keep this in mind!
- The presentation will consist of two parts:
 - First, 10 (ten) minutes will be given to show the project. Students will be required to use their application, describe its challenges and extents.
 - The 10-minute deadline will be hard: after ten minutes, the presentation will be stopped, and the exam will continue.
 - Then, each member of the team will be asked to describe a part of the project, with a set of specific questions.
- The project will determine a maximum total of **25 points** in the final evaluation.
- The individual questions will concern what was done in a particular part of the code. The quality of these answers will determine up to **8 points** in the evaluation.
- Each student will be required to know exactly and in great detail how the code presented works, no matter how much time has passed from since it was completed: answers like “We did it a long time ago, and I do not remember” will be considered as “sorry, I didn’t make that part of the project, and I didn’t really understand it”, resulting in an evaluation of zero points for the corresponding question.
- Students will be required to upload the source code of their projects. We will compile it and check whether it works as shown during the initial presentation.

- Part of the evaluation of the project will be based on the analysis of the source code that will be delivered.

3. *Exam registration*

- Please be aware that every student will be required to do two or three different forms of registration to be allowed to do the exam.
- As it will be defined later, the specific topic of one project, and the name of the students who created it will have to be entered into a specific form. This allows us to plan the sessions, know the composition of the groups and properly schedule the presentations.
- Students must always register for the exam using the on-line services registration page. This step is necessary because otherwise we will not have the opportunity to fill in the University server.
- Please remember that the exam day and room shown in the system will correspond only to one of the possible days on which the project presentation will take place: be aware of this when buying tickets or planning trips on the days close to the exam date, because your discussion might occur later than expected.
- As anticipated, if the number of attendees is large enough, a Form defining the extra days and the rooms for the discussions will be sent to all the students registered for one session. Each group will then use the form to select one of the available days for the discussion. This will allow us to properly define a presentation schedule.

4. *Final evaluation, score rejection and exam retrial*

- The final mark will be the sum of the scores of the project and of the answers to the questions, with the laude given in special circumstances. It will be communicated at the end of the session, (i.e. always later with respect to the discussion), because the evaluation of the code delivered will be done after the presentations.
- If there is clear evidence of the project not being done directly by the students, they will have to do a new one to pass the exam.
- Students can reject the evaluation and retry the exam: however, only one try will be allowed per session (i.e. one in June, July, or September, one in January or February).
- Students who retry the exam, will have to improve their project and / or discuss it again, depending on the specific case: the exact extra work to increase the score will be personally discussed with the students not accepting the marking, or being invited to do a new project. Each member of a group might independently decide to reject or accept the marking. The ones who accept the marking will be considered “removed” from the group, so the others will have to improve the previous work themselves.
